ОТЧЕТ

по лабораторной работе №8 по дисциплине «Искусственные нейронные сети»

Тема: Генерация текста на основе "Алисы в стране чудес"

Студент гр. 8383	 Федоров И.А.
Преподаватель	Жангиров Т.Р

Санкт-Петербург 2021

Цель работы.

Рекуррентные нейронные сети также могут быть использованы в качестве генеративных моделей. Это означает, что в дополнение к тому, что они используются для прогнозных моделей (создания прогнозов), они могут изучать последовательности проблемы, а затем генерировать совершенно новые вероятные последовательности для проблемной области. Подобные генеративные модели полезны не только для изучения того, насколько хорошо модель выявила проблему, но и для того, чтобы узнать больше о самой проблемной области.

Задачи

- Ознакомится с генерацией текста
- Ознакомиться с системой Callback в Keras

Выполнение работы.

Были импортированы необходимые для работы класы, модули, функции, а также данные *wonderland.txt*.

По методическим указаниям была построена реккурентная сеть, имеющая следующую структуру:

Model: "sequential"

Layer (type)	Output Shape	Param #
lstm (LSTM)	(None, 256)	264192
dropout (Dropout)	(None, 256)	0
dense (Dense)	(None, 45)	11565

Total params: 275,757 Trainable params: 275,757 Non-trainable params: 0

Была реализована функция gen_text(), которая с помощью переданной модели генерирует текст необходимой длины:

```
def gen_text(model, epoch=0, console_log=False, seq_len=1000):
    # pick a random seed
    start = np.random.randint(0, len(dataX)-1)
```

```
pattern = dataX[start]
    if console log:
        print("Seed:")
        print("\"", ''.join([int to char[value] for value in
pattern]), "\"")
    full result = []
    # generate characters
    for i in range(seq len):
        x = np.reshape(pattern, (1, len(pattern), 1))
        x = x / float(n vocab)
        prediction = model.predict(x, verbose=0)
        index = np.argmax(prediction)
        result = int to char[index]
        full result.append(result)
        seq in = [int to char[value] for value in pattern]
        if console log:
            sys.stdout.write(result)
        pattern.append(index)
        pattern = pattern[1:len(pattern)]
    print("\nDone.")
    return ''.join(full result)
```

Был реализован собственный callback TrainGeneratTextLogger(), который показывает то, как генерируется текст во время обучения (то есть раз в какое-то количество эпох гениририрует и выводит текст у необученной модели):

```
class TrainGeneratTextLogger(Callback):
   def on epoch end(self, epoch, logs=None):
       if not hasattr(self, 'freq'):
            self.freq = 2
       if not hasattr(self, 'save file'):
            self.save file = False
        if not hasattr(self, 'console log'):
            self.console log = True
        if not hasattr(self, 'seq len'):
            self.seq len = 1000
        if epoch % self.freq == 0:
            res = gen text(self.model, epoch,
                           console log=self.console log,
                           seq len=self.seq len)
            if self.console log:
                sys.stdout.write("Epoch {}:".format(epoch))
                sys.stdout.write(res)
            if self.save file:
                with open("gen text ep {}".format(epoch) + ".txt",
"w") as file:
                    file.write(res)
   def set freq(self, freq):
        self.freq = freq
```

```
def set_save_file(self, save_file):
    self.save_file = save_file

def set_console_log(self, console_log):
    self.console_log = console_log

def set_seq_len(self, seq_len):
    self.seq_len = seq_len
```

Так как обучение проходит очень медленно, то запуск производился в Google Colaboratory (файл .ipynb прикреплен к pull-request, текст программы приведет в приложении).

Были получены следующие результаты в ходе обучения:

График изменения потерь во время обучения показан на рис. 1.

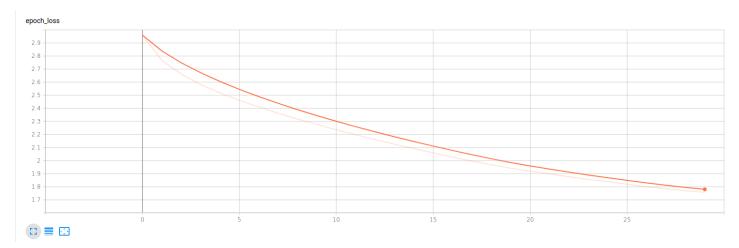

Рисунок 1 – График изменения потерь

Гистограммы значений активаций, получаемые слоями показаны на рис. 2.

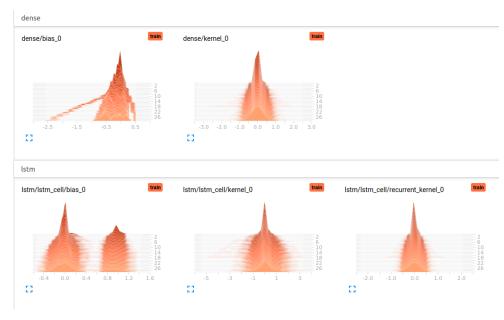

Рисунок 2 – Гистограммы активаций, получаемые слоями

При добавлении параметра validation_split=0.2 в метод fit(), получим следующий график изменения потерь по время обучения (рис. 3):

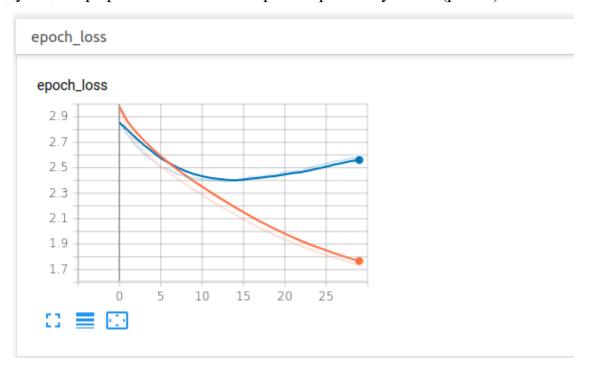

Рисунок 3 – График изменения потерь

По графику видно, что после 14 эпохи начинается переобучения, следовательно 13-14 эпохи являются оптимальными.

Выводы.

В ходе выполнения данной работы была реализована генеративная искусственная нейронная сеть, на основе "Алисы в стране чудес". Был реализован собственный callback TrainGeneratTextLogger(), который показывает то, как генерируется текст во время обучения (то есть раз в какоето количество эпох гениририрует и выводит текст у необученной модели). Была реализована функция gen_text(), которая с помощью переданной модели генерирует текст необходимой длины. Было проведено наблюдение с помощью TensorBoard.
